

EFFICIENT & ECOLOGICALLY-FRIENDLY PIG AND POULTRY PRODUCTION.

A WHOLE-SYSTEMS APPROACH TO OPTIMISING FEED EFFICIENCY
AND REDUCING THE ECOLOGICAL FOOTPRINT OF MONOGASTRICS.

BASIC DATA

Funding:

EU-FP7
(€ 6 million)

Start date:

1 February 2013

Duration:

48 months
(2013 to 2017)

TRIAL Nº B-443 (IRTA) ECO-FCE PROJECT. TRIAL Nº1 WP2: IDENTIFICATION AND OPTIMISATION OF FEED STRATEGIES

IRTA-CReSA

Results of Intestinal Microbiota (deep sequencing), Intestinal Mucosa Histology, Intestinal Mucosa Immunological Parameters

OBJECTIVES

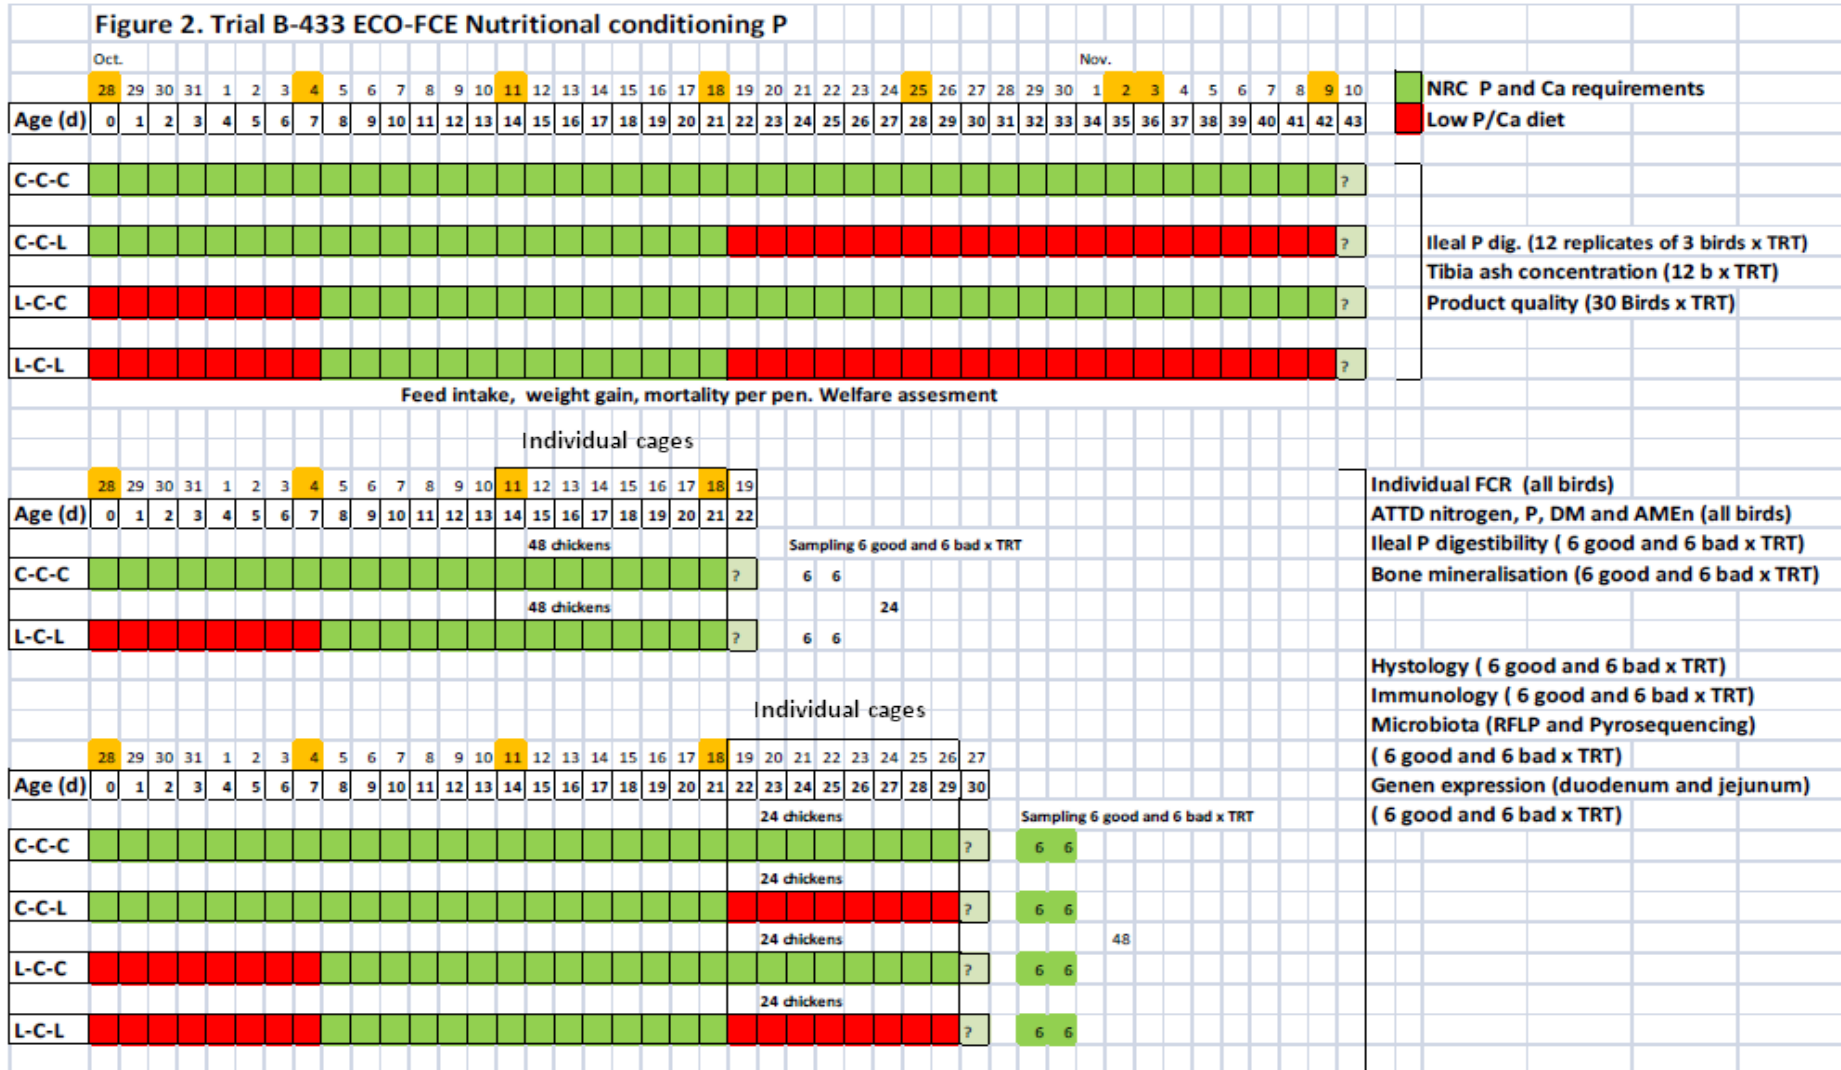

- The main objective was to investigate nutritional conditioning as a feeding regime strategy to improve the lifetime performance and nutrient utilisation of broiler chickens.
- In the present trial, the target nutrients were phosphorus and calcium, and the specific objective was to analyse differences between good and poor FCR animals.
- The criteria to evaluate the effects of P/Ca nutritional conditioning were:

Productive parameters (gain and efficiency), gut morphology and immunology, and intestinal microbiota composition in birds allocated individually from 14-22 days and from 22-30 days.

CONCLUSIONS

- During the second period of the trial, significant effect on intestinal morphology was observed for diet and FCR.
- Correlations (tendency) between some immunological parameters and FCR have been obtained: poor FCR higher inflammatory response.
- Significant differences of intestinal microbiota were obtained in relation with diet changes and FCR.
- Significant correlations between intestinal morphology, intestinal microbiota biodiversity and immunological parameters of intestinal mucosa were obtained.
