

RuminOmics Regional Workshop

Improving efficiency and reducing environmental impact

Tools for rapid analysis of animal phenotypes and the rumen microbiome

Kevin J. Shingfield

kes14@aber.ac.uk

RuminOmics: Connecting the animal genome, the intestinal microbiome and nutrition to enhance the efficiency of ruminant digestion and to mitigate the environmental impacts of ruminant livestock production

Project legacy: Identification of proxies and tools for large scale phenotyping for genomic selection, optimised nutrition and better management on-farm

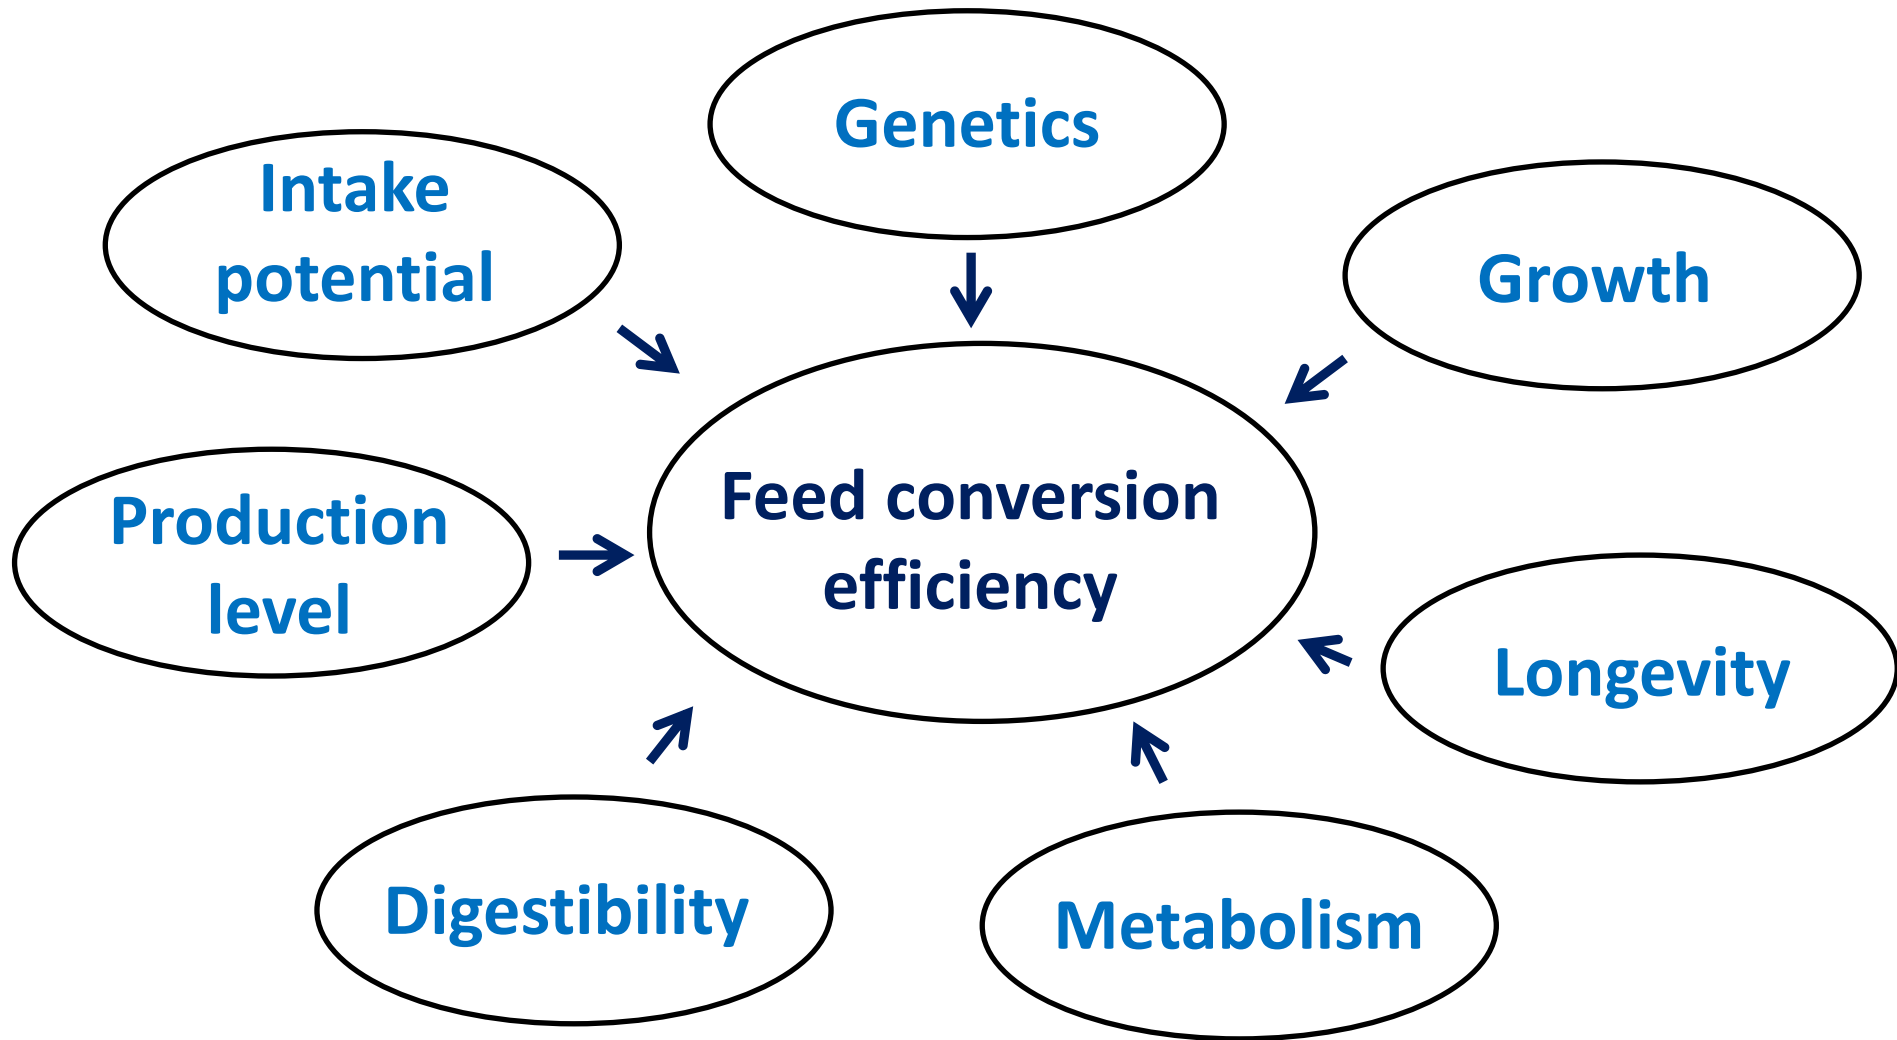

Challenges to ruminant livestock production

- Economic
- Environmental
- Societal

Scientific and technical solutions required

- Increase efficiency
- Lower emissions
- Improve product quality

Technical challenge: Phenotyping of complex traits

Advances in technologies

Technologies

- Sequencing/high density chips
- New “precision” devices for monitoring on farm
- FTIR and MS/MS: high throughput analysis

Tools

- Characterise microbial populations
- More extensive phenotypes
- Genomic selection

New phenotypes in dairy cattle

- **Large scale phenotyping: number of animals, number of traits and scales from molecule to whole animal**
- **Genetic selection requires phenotyping of thousands of animals that remains a major constraint**
- **Development of high-throughput methodologies are required for application on large populations according to standardized definitions and methods**

New traits and phenotypes in cattle

Rationale

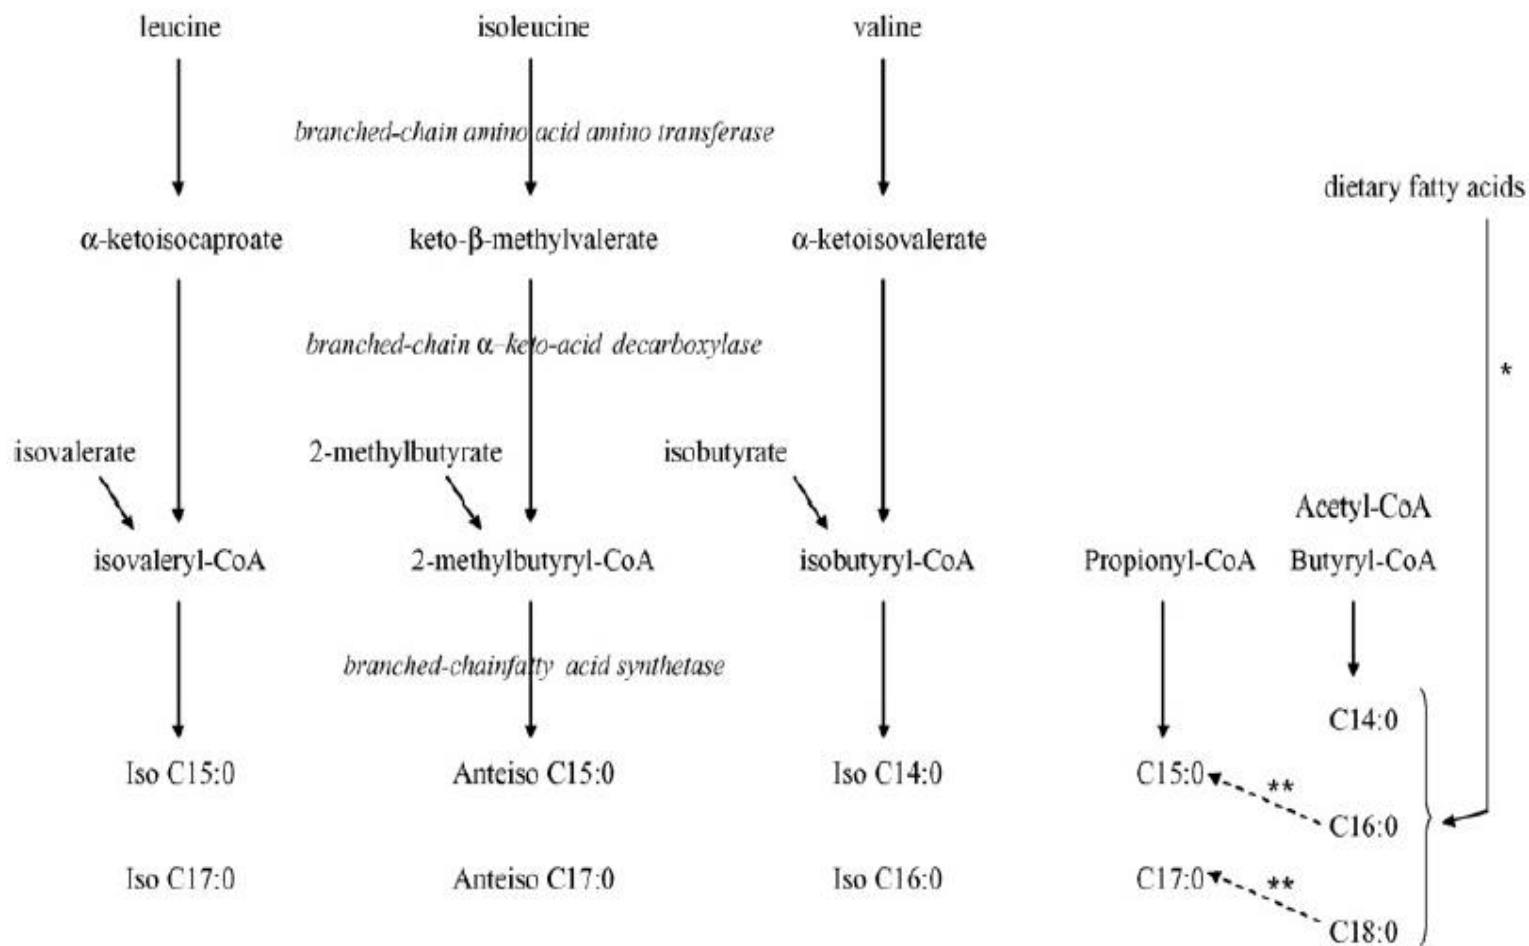

- **Balance between effort of data recording and benefit**
- **Cost effective alternatives to difficult or expensive to measure traits**

Diverse range of potential biomarkers

- **Breath**
Gas concentrations
- **Rumen**
qPCR 16S gene/Archaeol/pH
- **Milk**
Fat + Protein/SCC/Fatty acid composition/
Electrical conductivity/Lactoferrin/Minerals
- **Plasma**
NEFA/BHB/Urea/Insulin/Acute phase proteins
- **Faeces**
Archaeol

New phenotypes of rumen function

Odd and branched chain fatty acid synthesis in ruminal bacteria

Proportions of odd and branched chain fatty acids in bacterial membranes differ between species

Structural differences in membrane lipid of rumen archaea and bacteria

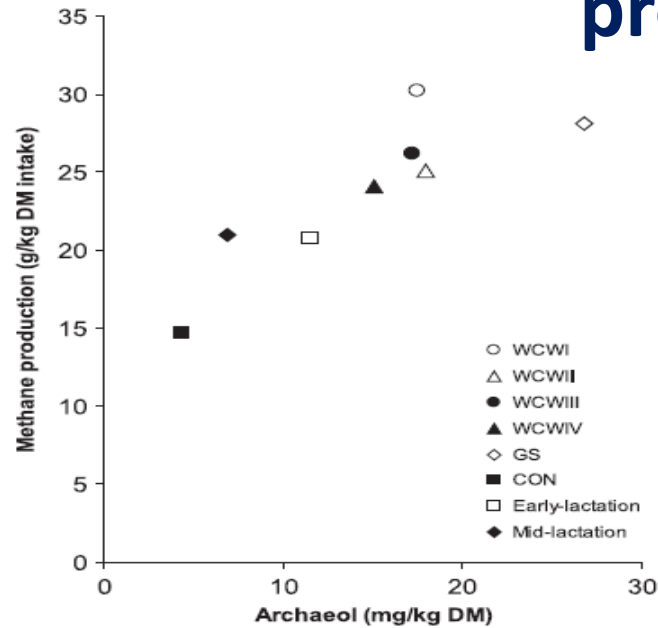

Bacteria

Archaea

Faecal archaeol as a biomarker of methane production

- Easy sample collection and processing
- Close relationship for treatment means
- Considerable variation between animals
- Poor predictor of rumen methanogenesis-selective retention in the rumen

Phenotypes of rumen function

- **Methane production**
- **Nutrient digestibility**
- **Rumen fermentation**

Development of new tools avoiding traditional constraints in hard to measure phenotypes

- **qPCR of 16S and 18S genes in ruminal digesta**
- **Metagenomics**

Archaeal abundance in *post-mortem* ruminal digesta may help predict methane emissions from beef cattle

Figure 7 | Methane emissions and the archaea : bacteria ratio (A : B) in ruminal digesta samples taken from live animals immediately after exiting the respiration chamber.

Development of Proxies and Phenotyping tools:

Lessons learnt in the RuminOmics project

**Can we find an alternative to sampling
rumen contents?**

BuccalAmp™ DNA Extraction Kit from Epicentre

Figure 1. BuccalAmp™ swab collection protocol.

Dry swabs – up to 1 week at RT
up to 6 month at -20 C

Performagene Livestock (PG-100) from DNA genotek

Holding the tube, rub the swab inside the animal's nostril for up to 5 seconds.

Hold the tube upright and unscrew the cap from the tube.

Turning the cap upside down, place the swab in the tube and close tightly.

Swabs in buffer – up to 12 month at RT

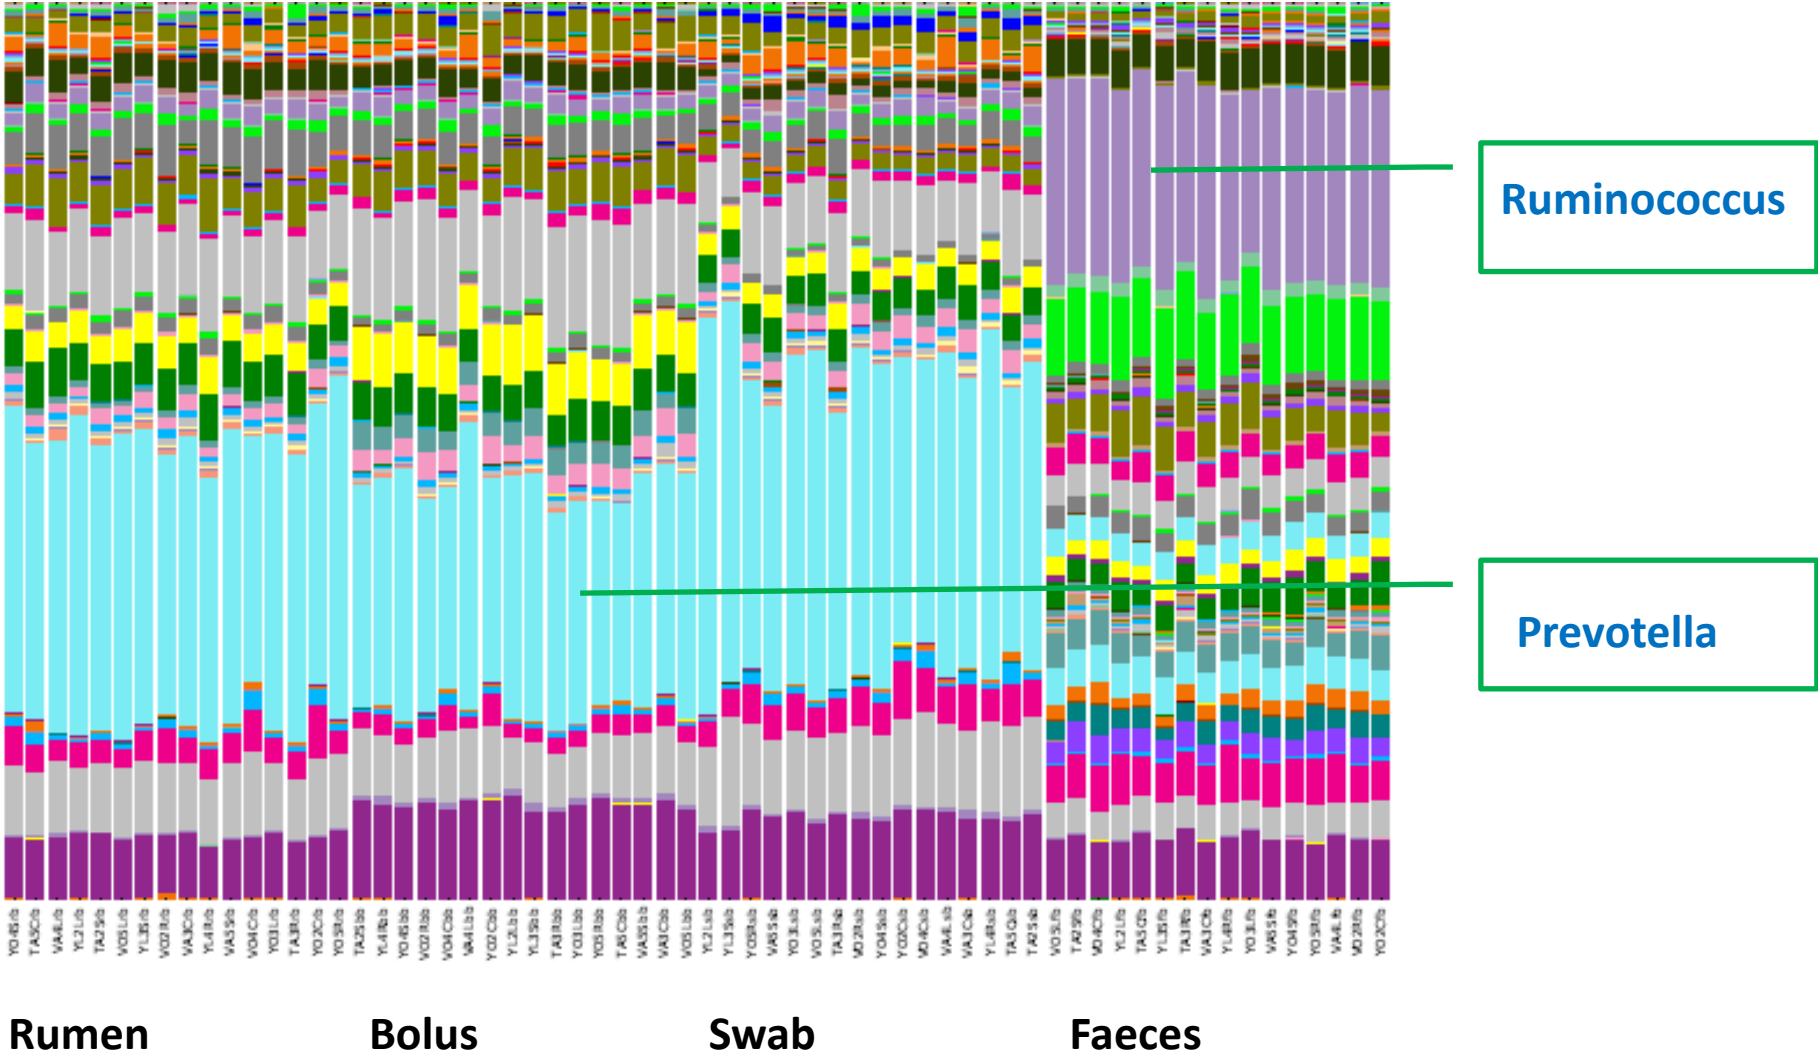

Performagene Livestock In PBS – glycerol buffer

Ciliate_even_5700

Outcomes

Faeces – not a viable surrogate of the rumen microbial community

Bacteria - bolus and buccal swab

Archaea - bolus and buccal swab

Anaerobic fungi – bolus and buccal swab

Ciliate protozoa - bolus

Nitrogen economy of the lactating cow

Annual nitrous oxide emissions in the UK

Total nitrous oxide emissions fell by 49% between 1990 and 2011. The largest reductions were in emissions from adipic acid production (a key raw material of polyurethanes) between 1998 and 1999. Reductions in industrial process emissions have continued to decline primarily due to decreases in the production of adipic and nitric acid.

- **N₂O accounts for ca. 6% of UK anthropogenic greenhouse gas emissions**
- **About 80% of N₂O from agriculture from soils**

Nitrogen intake, production and nitrogen use efficiency

**Milk urea concentration as a phenotype of
nitrogen use efficiency**

Measurements of milk urea nitrogen

Meta-analysis based on 306 treatment means from 50 experiments

Nousiainen et al., 2004

Meta-analysis to understand between-animal variation in MUN and rumen ammonia N concentrations and the association with diet digestibility and N use efficiency

- **1804 cow/period observations from 21 production trials**
- **450 cow/period observations from 29 metabolic studies**
- **Data were analyzed by mixed-model regression analysis**
- **Model included diet within experiment and period within experiment as random effects: effect of diet and period excluded**

Results

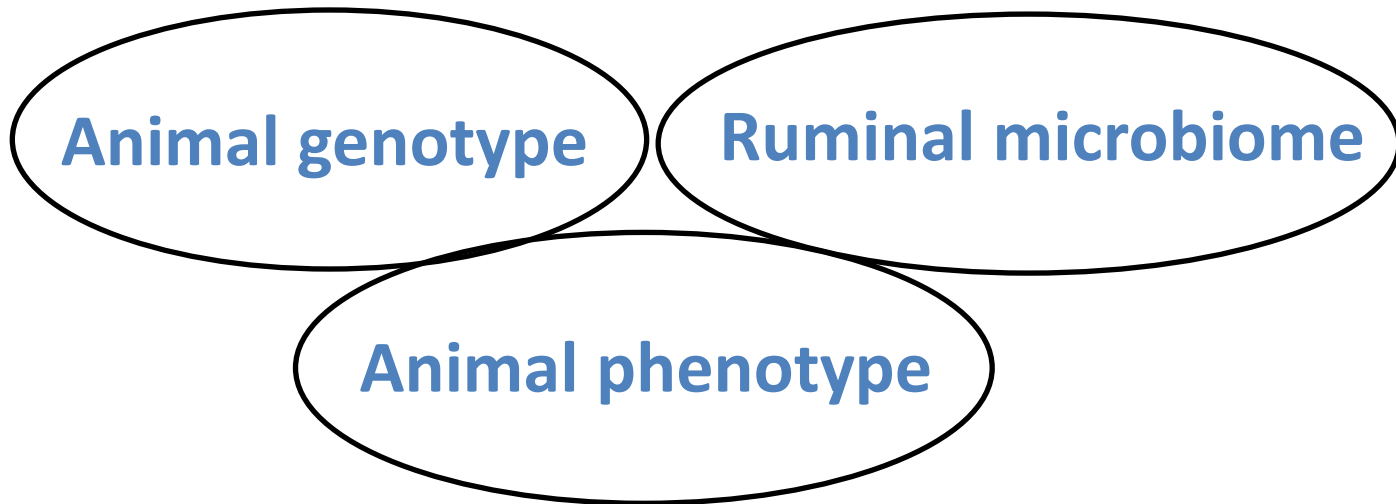

- **Between cow variation in MUN 0.13 and 0.11 % for production and metabolic datasets**
- **Between cow variation in MNE 0.07 and 0.08 % for production and metabolic datasets**
- **Including MUN and RAN in the model accounted for more variation in MNE than milk yield alone**
- **Between-cow variation had a smaller influence on the relationship of MUN with urinary N excretion or MNE than when based on treatment means**

Conclusions

- **Between-cow variation in MUN had a smaller effect on MNE compared with published responses of MUN to dietary crude protein content**
- **Closer control over diet composition relative to requirements has greater potential to improve MNE and lower UN on farm than genetic selection**
- **Measurements of MUN are more useful as a management tool than as a phenotype for genetic selection of more nitrogen efficient cows**

Future perspectives

RuminOmics – Large scale data

Intake, milk production, digestibility, methane output, fermentation characteristics, blood metabolome, milk fatty acid composition

Project goals

- **Understanding the role of host animal genetics, rumen microbiome and diet on methane production, nitrogen emissions, feed efficiency and milk quality**

Outcomes

- **Generation of new large data for mining new biomarkers of rumen function, animal performance and milk fatty acid composition**

Thank you for your attention
